## Authors

The Homelessness Research Institute of the National Alliance to End Homelessness prepared this report. The primary authors of the paper are Mary Cunningham and Meghan Henry.

## Acknowledgements

The authors thank Samantha Batko and Webb Lyons of the National Alliance to End Homelessness for providing careful editing. Any errors or omissions are, of course, the responsibility of the authors.

National Alliance to  
**END HOMELESSNESS**

The National Alliance to End Homelessness is a nonpartisan, mission-driven organization committed to preventing and ending homelessness in the United States.

## Our work

The National Alliance to End Homelessness is a leading voice on the issue of homelessness. The Alliance analyzes policy and develops pragmatic, cost-effective policy solutions. We work collaboratively with the public, private, and nonprofit sectors to build state and local capacity, leading to stronger programs and policies that help homeless individuals and families make positive changes in their lives. We provide data and research to policymakers and elected officials in order to inform policy debates and educate the public and opinion leaders nationwide. Guiding our work is *A Plan, Not a Dream: How to End Homelessness in Ten Years*. The Ten Year Plan identifies our nation's challenges in addressing the problem and lays out practical steps our nation can take to change its present course and truly end homelessness within 10 years. To learn how to end 20 years of homelessness in 10 years, please visit [www.endhomelessness.org](http://www.endhomelessness.org).

## Homelessness Research Institute

The Homelessness Research Institute at the National Alliance to End Homelessness works to end homelessness by building and disseminating knowledge that drives policy change. The goals of the Institute are to build the intellectual capital around solutions to homelessness; to connect with researchers across the country to ensure that policymakers, practitioners, and the caring public have the best information about trends in homelessness demographics, research, and emerging solutions; and to engage the media to ensure intelligent reporting on the issue of homelessness.

# Summary

A movement to end homelessness is underway. Thousands of stakeholders—policymakers, advocates, researchers, practitioners, former and current homeless people, community leaders, and concerned citizens—from across the country are involved in efforts to end homelessness at the local and national level. Today, hundreds of communities are re-tooling their homeless assistance systems and have committed to ending homelessness through local plans. At the federal level, the U.S. Department of Housing and Urban Development’s (HUD) homelessness assistance programs are targeting resources to permanent housing, and the Congress and the Bush Administration have committed to ending chronic homelessness by developing 150,000 units of permanent supportive housing for people who have been homeless for long periods. The private sector, through major philanthropic organizations, is engaging and funding efforts that focus on permanent solutions for homeless people. And new research and imaginative policies at the state and local level are paving the way. Taken together, these efforts represent a nationwide effort to end homelessness.

This report lays the groundwork for measuring efforts to end homelessness by establishing a baseline number of homeless people from which to monitor trends in homelessness.

Today, thousands of people—policy-makers, advocates, researchers, practitioners, former and current homeless people, community leaders, philanthropist, and citizens—from across the country are working to end homelessness.

- In total, 98,452 homeless families were counted.
- 23 percent of homeless people were reported as chronically homeless, which, according to HUD's definition, means that they are homeless for long periods or repeatedly and have a disability.
- A number of states had high rates of homelessness, including Alaska, California, Colorado, Hawaii, Idaho, Nevada, Oregon, Rhode Island, and Washington State. In addition, Washington, DC had a high rate of homeless people.

These statistics show that far too many people are homeless. There is, however, reason for optimism. During the past five years, community approaches to homelessness have changed and thousands of people are working toward the shared goal of ending homelessness. Measuring their success or failure will depend on collecting and analyzing outcome data, monitoring changes in homelessness populations, and understanding which interventions lead to different outcomes. Yet, up until now, we had no recent data on how many people are homeless in the United States. The data in this report represent the first effort to count homeless people nationwide in 10 years. We hope to make this report an annual report, tracking progress on the efforts to end homelessness nationwide. It is our belief that what gets measured, gets done.

## Ending Homelessness in America

Can we really end homelessness? In 2000, the National Alliance to End Homelessness issued a challenge to American communities to end homelessness in 10 years. Our Ten Year Plan provides a road map: (1) strengthen prevention; (2) focus on permanent housing; (3) support long-term, data-driven strategies at the community level; and (4) rebuild the support system for low-income Americans.<sup>1</sup>

Today, thousands of people—policymakers, advocates, researchers, practitioners, former and current homeless people, community leaders, philanthropists, and citizens—from across the country are working to end homelessness. They are dramatically changing the landscape for homeless people and leading communities in a new direction that reaches for results. Their efforts are striking:

- Over 200 communities across the country are undertaking planning efforts to end homelessness; 90 of these communities have completed plans.<sup>2</sup> Answering a challenge from the U.S. Interagency Council, the National League of Cities, National

<sup>1</sup> To read the National Alliance to End Homelessness' Ten Year Plan, *A Plan, Not a Dream: How to End Homelessness in Ten Years*, please visit [www.endhomelessness.org](http://www.endhomelessness.org).

<sup>2</sup> See "A New Vision: What Is in Community Plans to End Homelessness," National Alliance to End Homelessness (2006).

Association of Counties, and U.S. Conference of Mayors have committed to the goal of ending chronic homelessness at the local level.<sup>3</sup>

- Policy changes at the U.S. Department of Housing and Urban Development (HUD) are ensuring that Continuums of Care (CoCs), the local or regional bodies that coordinate services and funding for homeless people and families, focus on permanent housing.<sup>4</sup> Many communities are re-tooling their homeless assistance systems using Housing First approaches that help people exit shelter and access affordable housing faster.<sup>5</sup>
- President Bush made ending chronic homelessness in 10 years an administration-wide goal and, each year since 2004, the President has requested an increase in homelessness assistance funding.<sup>6</sup>
- Congress, on a bipartisan basis, committed to creating 150,000 units of permanent supportive housing for chronically homeless people. The 90 community plans completed to date call for creating 80,000 permanent supportive housing units.<sup>7</sup>
- Major foundations and corporations came together with the Corporation for Supportive Housing and the National Alliance to End Homelessness to form the Partnership to End Long Term Homelessness (PELTH), committing \$36 million to the problem and pledging to engage the philanthropic sector in the effort.<sup>8</sup>
- New research on chronic homelessness crystallized effective solutions, highlighting the need for permanent supportive housing. Research on how to get families back into housing faster is emerging.<sup>9</sup>

Taken together, these efforts represent a national effort to end homelessness. Today, homelessness is a problem with a solution, instead of something that will always exist no matter what we do or how much money we throw at it. Challenges remain formidable, but these efforts have the potential to translate into nationwide declines in homelessness. How will we know if they are successful? The purpose of this report is to create a baseline from which to measure progress in ending homelessness. To do so, we compiled local point-in-time counts of homeless people taken in 2005. This report discusses the importance of setting a baseline, provides a brief history of counting homeless people, and then presents our findings from this analysis, including a national estimate and counts of homeless people by state and community.

This report discusses the importance of setting a baseline, provides a brief history of counting homeless people, and then presents our findings from this analysis, including a national estimate and counts of homeless people by state and community.

<sup>3</sup> In 2003, at the annual meeting of the U.S. Conference of Mayors, U.S. Interagency Council on Homelessness Executive Director Philip Mangano challenged 100 cities to create plans to end chronic homelessness and the U.S. Conference of Mayors adopted a resolution in support of this challenge. The National League of Cities and the National Association of Counties also adopted resolutions in favor of plans to end homelessness.

<sup>4</sup> HUD has renewed the department's public commitment to providing permanent housing through the homeless assistance program. The percentage of HUD homeless assistance funding that goes to housing has increased substantially. In 2005, 58 percent of funds supported housing activities versus just 43 percent in 1998. See HUD (2006c).

<sup>5</sup> For more information on communities making progress in ending homelessness, please see our *Community Snapshot* series available at [www.endhomelessness.org](http://www.endhomelessness.org).

<sup>6</sup> The first commitment came from HUD Secretary Mel Martinez in his remarks at the National Alliance to End Homelessness' annual conference. See "Taking on the Problem that 'Cannot Be Solved.'" Remarks prepared for delivery by Secretary Mel Martinez, Friday, July 20, 2001. President Bush later made a commitment in the FY 2003 Federal Budget.

<sup>7</sup> See "A New Vision: What Is in Community Plans to End Homelessness," National Alliance to End Homelessness (2006).

<sup>8</sup> For more information on PELTH, visit [www.endlongtermhomelessness.org](http://www.endlongtermhomelessness.org).

<sup>9</sup> Some of the most important research on permanent supportive housing has been conducted by Dr. Dennis Culhane of the University of Pennsylvania. See Culhane (2002) for details on findings and Gladwell (2006) for a description of how the research can be applied and why it is revolutionizing approaches to homelessness.

# Measuring Progress and Creating a Baseline

Collecting data on homelessness and tracking progress can inform public opinion, increase public awareness, and attract resources that lead to the eradication of the problem.

Now that the goal of ending homelessness is set—and supported by the President, Congress, and community leaders—measuring progress is the next critical step. “What gets measured, gets done” is a popular adage that rings true. If we do not measure progress, we will not know if efforts to end homelessness are showing results. To measure progress, stakeholders must establish a baseline to record how many people are currently homeless. Next, numeric targets and a time line to meet the goal of ending homelessness should be developed. The final step in measuring progress is collecting data on specific performance measures and monitoring outcomes. Data are critical to measuring and tracking progress over time. Unfortunately, collecting data on how many people experience homelessness is a costly endeavor fraught with methodological, logistical, and political challenges.

## Setting a National Baseline: Estimating the Number of Homeless People

How many people are currently homeless in the United States? The answer to this question is important because it establishes the dimensions of the problem and helps policymakers and program administrators track progress on the goal of ending homelessness. Collecting data on homelessness and tracking progress can inform public opinion, increase public awareness, and attract resources that lead to the eradication of the problem. Notwithstanding the critical role of data in crafting solutions to end homelessness, the task of estimating the number of homeless people and collecting data on their characteristics is considerably difficult.

The challenges associated with estimating the number of homeless people are not new. Since the mid-1980s, advocates, policymakers, and researchers have struggled with the

## A Brief History of Counting The Homeless Population

Counting the number of homeless people in the United States is methodologically challenging and highly political—a dangerous combination with an interesting history. Past estimates of the number of homeless people range from 250,000 to 3 million homeless people (see Table 1). The 3 million estimate was put forth in 1983 by Mitch Snyder and Mary Ellen Hombs of the Community for Creative Non-violence (CCNV). Hombs and Snyder arrived at the number by asking service providers in 14 cities how many people were homeless and then extrapolated, using an unknown method, to get a figure of 2.2 to 3 million.<sup>a</sup> Although generally viewed as a “guestimate,” the numbers were used repeatedly by the media, eventually becoming ubiquitous.

In 1984, HUD conducted a similar study that also involved local informant estimates as well as enumeration and reported a figure a fraction of the size. The HUD report estimated 250,000–350,000 homeless people at a point in time. Despite the fact that the HUD number was arrived at by professional social scientists, the estimate was “greeted by advocates, media pundits, and sundry members of Congress with fury.” HUD was accused of having a “hidden agenda” and of “rig[ging] the numbers.”<sup>b</sup> The political implication of the difference between the activist’s counts and the HUD counts are still felt and provide good reason to approach homelessness counts with care and caution.

The Census Bureau attempted to include individuals living on the street and in places not intended for human habitation in the 1970, 1980, and 1990 decennial censuses. In 1980, the Census conducted a “casual count” of the homeless population by selecting urban areas over a two-week period. This count took place six weeks after the Decennial Census and involved shelter counts during evening hours and public places sampling during the day. Enumerators interviewed people at employment offices and welfare and food stamp offices, as well as street locations and parks until 8:00 p.m., to identify individuals who had not been included in the original count. Due to methodological problems, the count was not released.

In 1987, the Urban Institute conducted a study providing one-day and one-week estimates on the number of homeless people in the country. This month-long project counted clients of shelters as well as soup kitchens. Enumerating at soup kitchens allowed the researchers to count the often difficult-to-count street population. This study estimated 229,000 homeless adults and children on any given day in cities of over 100,000 people.<sup>c</sup>

In 1990, Census enumerators again performed the shelter count during the late evening and early morning hours, but decided to use a nighttime street enumeration instead of the day count for the 1990 decennial census. On March 20–21, 1990, the S-Night count resulted in about 228,000 homeless persons enumerated. The Bureau believed that the 1990 S-Night count procedures enabled them to resolve any concerns about double-counting.<sup>d</sup>

In 1996, the U.S. Interagency Council on Homelessness contracted the Urban Institute to conduct the last national count of homeless people in the United States. The National Survey of Homeless Assistance Providers and Clients had a number of methodological variations from previous counts. It did not include a street count, but counted clients at soup kitchens, shelters, and other homeless service providers. The study found that between 444,000 and 842,000 people in the United States are homeless. This study, conducted more than 10 years ago, is the last national count.

<sup>d</sup> See *Counting the Homeless: Limitations of the 1990 Census Results and Methodology* (U.S. General Accounting Office, 1991).

... estimates of the number of homeless people are highly controversial and are often met with skepticism. Counting the number of homeless people has been described as a “high-stakes numbers game.”

**A Brief History of Counting The Homeless Population** *(continued)*

Year	Homeless Estimate	Methodology	Source
1980	---	Evening shelter count, daytime public places sampling, interviews at welfare and employment offices. (S-Night)	Census Bureau
1983	2.2–3 million	Estimates by local informants extrapolated to national figure	CCNV
1984	250,000–350,000	Estimates by local informants; selected city street and shelter counts	HUD
1987	229,000	Surveys/counts of homeless service providers	Urban Institute
1990	228,000	Nighttime street and shelter count (S-Night)	Census Bureau
1996	842,000 (February); 444,000 (October)	Surveys/counts of homeless service providers.	Urban Institute

task of assembling accurate estimates (see “A Brief History of Counting Homeless People”).<sup>10</sup> Defining who is homeless, essentially identifying who to count, even with an official definition, is a complicated task. By attempting to count a population that is without a home or, as some say, “without place,” enumeration efforts must overcome problems that are inherent to the question they seek to answer. Finding homeless people—notably homeless people living on the street rather than in emergency shelters—is often the biggest challenge. For all of these reasons and many more, estimates of the number of homeless people are highly controversial and are often met with skepticism. Counting the number of homeless people has been described as a “high-stakes numbers game.”<sup>11</sup>

The last nationwide count, and the most rigorous national estimate, of homeless people—the National Survey of Homeless Assistance Providers and Clients (NSHAPC)—was taken over 10 years ago in 1996. This research was sponsored by the U.S. Interagency Council on Homelessness and conducted by the Urban Institute. Based on counts of homeless people from a sample of homeless service providers from across the country, the study found that between 444,000 and 842,000 people in the United States are homeless.<sup>12</sup> At the time, the lead researcher of the study, Martha Burt of the Urban Institute, estimated the actual number of homeless people to be around 800,000.<sup>13</sup> The NSHAPC study estimate provides data on how many people are homeless at a specific point in time. The reality is that the homeless population is quite fluid—people move in and out of homelessness and

<sup>10</sup> See Homelessness in America (Baumohl, 1996) for a historical review of efforts to enumerate homelessness in the United States.

<sup>11</sup> See “Counting the Homeless Is a High Stakes Numbers Game” (Rivenburg, 2006).

<sup>12</sup> See America’s Homeless II: Populations and Services (Urban Institute, 2000) for more on the study, estimates, and sampling methods.

<sup>13</sup> See What Will It Take to End Homelessness? (Burt, 2001).

most are homeless for short periods of time. To create an annual estimate of homelessness, Burt and colleagues extrapolated this number, estimating that between 2.3 and 3.5 million people per year experience homelessness.<sup>14</sup>

Although this landmark study revealed a wealth of information on homelessness, national enumeration efforts like the one described above are logistically difficult, methodologically challenging, and expensive. To overcome these challenges, HUD has undertaken two strategies to improve the availability of the data: (1) requiring CoCs to develop administrative data systems; and (2) requiring CoCs to conduct point-in-time counts every other year. Both of these strategies focus on collecting data locally and then aggregating to obtain a national estimate. The first strategy was initiated in 2001, when Congress required all CoCs to create Homeless Management Information Systems (HMIS).<sup>15</sup> These administrative data systems collect data on the characteristics of homeless people entering and exiting the homeless assistance system. Progress on HMIS has been slow, but steady. Today, almost 75 percent of CoCs have implemented HMIS systems.<sup>16</sup> HMIS is a critical tool, but it only collects data on homeless people inside the system. To overcome this gap, in 2003, HUD required CoCs to collect data on the number of people who are homeless—both sheltered and unsheltered—in their community.<sup>17</sup> The quality of these point-in-time counts is uneven, with some jurisdictions using more rigorous methods than others. There have, however, been significant efforts from HUD to provide guidance and increase technical assistance to help local communities collect accurate estimates.<sup>18</sup>

## About the Data in This Report

The purpose of this report is to establish a nationwide baseline—an estimate of how many homeless people sleep in shelters and on the streets—so that we can measure progress toward the goal of ending homelessness. The data in this report are estimates of how many people experience homelessness in communities across the United States. The report tabulates and summarizes data from 463 CoC point-in-time studies conducted in 2005.

The purpose of this report is to establish a nationwide baseline—an estimate of how many homeless people sleep in shelters and on the streets—so that we can measure progress toward the goal of ending homelessness.

<sup>14</sup> Urban Institute (2000).

<sup>15</sup> See FY 2002 Appropriations Bill.

<sup>16</sup> For more information on HMIS progress, see Report to Congress: Fifth Progress Report on HUD's Strategy for Improving Homeless Data Collection, Reporting, and Analysis (HUD, 2006b).

<sup>17</sup> See SuperNOFA (HUD, 2003).

<sup>18</sup> See A Guide to Counting Homeless People (HUD, 2006a) for more on community approaches to counting homeless people.

No data are without flaws and limitations. As such, these counts are not perfect and should be used as rough guidelines rather than precise estimates. The data limitations for the local point-in-time counts in this report are similar to all counts of homeless people. The limitations include definitional issues, finding homeless people, data collection and enumeration methods, sampling and extrapolation, de-duplicating, and differing time frames. In addition, because it is up to CoCs to design data collection methods that meet local needs, each CoC uses different methods to collect and assemble an estimate. This means that in addition to general limitations, each local point-in-time estimate holds its own unique data limitations. Because communities used varying methods for collecting point-in-time data, we caution the users of these data against comparing the data by jurisdiction because doing so runs the risks of the “apples and oranges” problem. Additional information about the methodology that CoCs use to assemble estimates can be found in an appendix to this report.

# National Estimate

By tabulating local point-in-time estimates, we found that 744,313 people in the United States experienced homelessness in January 2005. This number is adjusted for data summation errors and inaccurate outliers.<sup>19</sup> We provide both the adjusted total and the unadjusted total for the reader (see Table 1). The total adjusted estimate for January 2005 (744,313) falls within the parameters of the 1996 estimate; however, it is difficult to say if the 2005 estimate is an increase, decrease, or no change from the 1996 estimate. While it is hard to say anything about trends in homelessness during the past

Table 1 Estimates of U.S. Homelessness		
Total Homeless Estimate January 2005 Adjusted Total <sup>a</sup>	Total Homeless Estimate January 2005 Unadjusted Total <sup>b</sup>	Total Homeless Estimate 1996 <sup>c</sup>
744,313	804,212	444,000–842,000

<sup>a</sup>This number is an adjusted tabulation of 2005 CoC point-in-time estimates. These data were adjusted and corrected for data entry errors, summation errors, and outliers that provided unscientific estimates or estimates that did not follow HUD’s guidance for counting homeless people. For more on data cleaning techniques, please see the methodological appendix.  
<sup>b</sup>The unadjusted total is the total before we cleaned the data as described above and in the methodological appendix.  
<sup>c</sup>See Burt et al. (1999) for a description of the last national estimate of homelessness.

<sup>19</sup> See the methodological appendix for more information on data cleaning techniques.

10 years, it is worth noting that the size of the U.S. population, something that could affect the size of the homeless population, increased dramatically during this period. Further, while we do make comparisons to the general population and poor population, point-in-time estimates only tell us how many people are homeless at a given time; the reality, however, is that many more people experience homelessness annually—people move in and out of homelessness and most people are homeless for only a short period of time. The NSHAPC study estimated that between 2.3 and 3.5 million people are homeless in a given year—nearly 1 to 2 percent of the total population.<sup>20</sup> In short, point-in-time counts, like the estimates in this report, will always represent a smaller percentage of the population when compared to annual estimates.

## Sheltered or Unsheltered

The CoC estimates enumerate how many homeless people are living in shelters (this can include emergency shelters and transitional housing) and how many homeless people are literally sleeping and living on the street. The estimates show that 56 percent (407,813) of homeless people were living in shelters and 44 percent (322,082) of homeless people were unsheltered (see Exhibit 1). These point-in-time surveys were taken in January, so it is shocking that more than 300,000 people were sleeping on the street. These data suggest two possible explanations for the high number of people living on the streets: the lack of capacity of the emergency shelter system and the system's inability to bring people in from the street (either because they do not want to stay in a shelter or because the shelter does not have an adequate number of beds).

**Exhibit 1** Percentage Sheltered vs. Unsheltered

<sup>20</sup> This study does not have the necessary data to create a national annual estimate; however, local Continuums of Care should be able to calculate an annual estimate.

# Single Adults And Families with Children

Household structure is an important factor in responding to homelessness because single adults and families with children may have different needs. Approximately 59 percent (437,710) of the homeless population counted in 2005 were individuals and 41 percent (303,551) were persons in families with children (see Exhibit 2).

In total, there were 98,452 homeless families counted. These data represent a slight shift from the 1996 data in the percentage of individuals versus persons in families with children. The NSHAPC study showed that, at a point in time, 35 percent of homeless clients were persons in families and 65 percent were single adults. This increase in the percentage of persons in families with children can be explained by a number of possible factors, including differences in methodology between the studies, a decrease in the single adult population, or an actual increase in the percentage of homeless persons with families.

## Chronic Homelessness

Chronically homeless people represent an estimated 23 percent (171,192) of the total homeless population counted in 2005 (see Exhibit 3).<sup>21</sup> This estimate is similar to previous estimates of 150,000 to 200,000 chronically homeless people.<sup>22</sup> It

<sup>21</sup> According to HUD's definition, a person who is "chronically homeless" is an unaccompanied homeless individual with a disabling condition who has either been continuously homeless for a year or more, or has had at least four episodes of homelessness in the past three years. In order to be considered chronically homeless, a person must have been sleeping in a place not meant for human habitation (e.g., living on the streets) and/or in an emergency homeless shelter. A disabling condition is defined as a diagnosable substance use disorder, serious mental illness, developmental disability, or chronic physical illness or disability including the co-occurrence of two or more of these conditions. A disabling condition limits an individual's ability to work or perform one or more activities of daily living.

<sup>22</sup> Past estimates of the number of adults who experience chronic homelessness from the National Alliance to End Homelessness and the Millennial Housing Commission range from 150,000 to 200,000. See Millennial Housing Commission (2002).

should be noted, however, that counting the number of chronically homeless single adults using point-in-time methods has inherent difficulties. Chronically homeless adults are by definition those who have been homeless for long periods or who experience repeated episodes of homelessness. Identifying chronically homeless people at a point in time means asking homeless people to self-identify as chronically homeless or asking service providers to identify who is chronically homeless. Both of these methods suffer from obvious reliability problems. As

HMIS systems increase their coverage rates, program administrators will be able to estimate more accurately the number of people who experience chronic homelessness.

## Homelessness by State

Exhibit 4 and Table 2 present estimates of homelessness by state, including the District of Columbia, Puerto Rico, Guam, and the U.S. Virgin Islands. We created the state totals by summing the CoC estimates in each state. A number of states had high rates of homelessness per capita, including Alaska, California, Colorado, Hawaii, Idaho, Nevada, Oregon, Rhode Island, and Washington state. In addition, Washington, DC had a high rate of homeless people.

**Table 2** Estimates of Homelessness by State

State	Sheltered	Unsheltered	Adjusted Total	Population	Pct of State Pop.
AK	1,431	1,318	2,749	663,661	0.41%

*Notes.* \* Totals for these states were adjusted to more closely reflect HUD guidelines. For Hidalgo, TX, we used their actual enumerated figures instead of the extrapolated figures. For Los Angeles, we removed the extrapolated population figure considered “doubled up” by telephone survey. For more on the methods we used, please see the methodological appendix. The state population numbers are from the American Community Survey 2005. Please note that the homeless counts are point-in-time estimates and do not fully capture the number of people who experience homelessness over the course of a year. The percentage of people who experience homelessness in the general population would be much higher if annual estimates were available.

#### Exhibit 4 Estimates of Homelessness by State

\* Please note that these homeless estimates are point-in-time and do not fully capture the number of people who experience homelessness over the course of a year. The percentage of people who experience homelessness in the general population would be much higher if annual estimates were available.

# Homelessness by Community

**H**ow many people are homeless in your community? Every community in the country includes a Continuum of Care (CoC). CoC geographies are composed of one or more cities and counties and do not overlap. CoCs are the closest proximate of cities and towns, even though most CoCs include contiguous areas. Appendix A provides estimates of homelessness by CoC.

## Conclusion

**T**he data in this report represent the first effort to count homeless people nationwide in 10 years. Much has changed since that time in terms of data and research on homelessness. HUD and local communities are overcoming technical inertia, despite lack of funding and scarce resources, and are putting more emphasis on collecting data, tracking how many people are homeless, and understanding the characteristics of homeless people. These data will help policymakers understand the scope of the problem and identify communities that are making progress and communities that are struggling to find effective responses to homelessness. Data will also help garner national attention to the issue. Taken as a whole, the efforts to end homelessness from across the country are striking, but despite efforts to end homelessness, and some progress in a handful of communities, this report shows that far too many people remain homeless in America.

# Appendix A: Homelessness Estimates by CoC

# Appendix B: Methodology

**T**his report summarizes and tabulates data from 463 CoC point-in-time studies conducted in 2005. Each year, CoCs submit these data to HUD in the Exhibit 1 table of the SuperNOFA application. We obtained the data in electronic form from Abt Associates with permission from HUD.

## Methodology

In the 2005 SuperNOFA application the Exhibit 1 table was accompanied by a methodological narrative supplied by the CoC. The narrative describes their methods for collecting point-in-time data. Research staff from the Homelessness Research Institute at the National Alliance to End Homelessness read through each methodology, entering key variables into a database. This information helped us understand how the sites collected the data. There are limits to this approach—most notably that the narratives are open-ended and often leave out key information. Nevertheless, the methodological narratives are the only widely available information on how the data were collected so we are including them in this report. For more information on how the data were collected, local Continuums of Care should be contacted. We summarized our analysis of the narratives in a technical appendix, available at [www.endhomelessness.org](http://www.endhomelessness.org).

## Data Cleaning

We took a number of steps to ensure the data were as accurate as possible. We adjusted the data for three types of errors: (1) data entry errors; (2) summation errors; and (3) outliers or data inconsistencies. For the first two types of errors, we adjusted to the total. For the third type of adjustment, there were two outliers in the data set that we adjusted: Hidalgo Continuum of Care (TX-506) and Los Angeles Continuum of Care (CA-600). Hidalgo CoC reported 40,816 homeless people in 2005. This number is significantly higher than the number Hidalgo reported in 2004. Further investigation revealed that the number was in fact an unscientific estimate and we adjusted the total to reflect the actual number of homeless people counted in 2005 (this number is listed in the methodological appendix) instead of the extrapolation that was originally included in Hidalgo's Exhibit 1 report. Los Angeles reported 83,347 total homeless people. This number, however, includes an estimated 23,058 homeless people who are doubled up and were counted through a phone survey based on a sample of 1,000 respondents. HUD's definition of homelessness does not include individuals or families that are doubled up, so we adjusted Los Angeles' estimate to reflect only the number of homeless people who met HUD's definition.
